
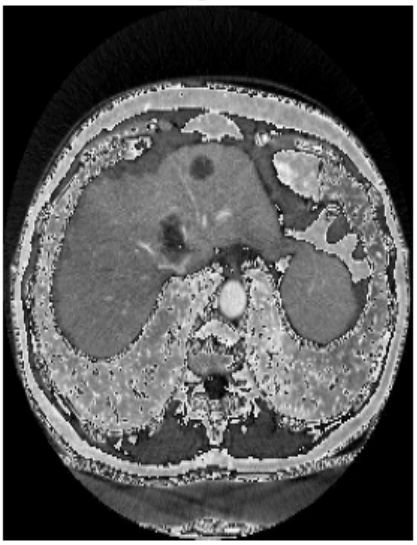
LIVER ANALYSIS REPORT

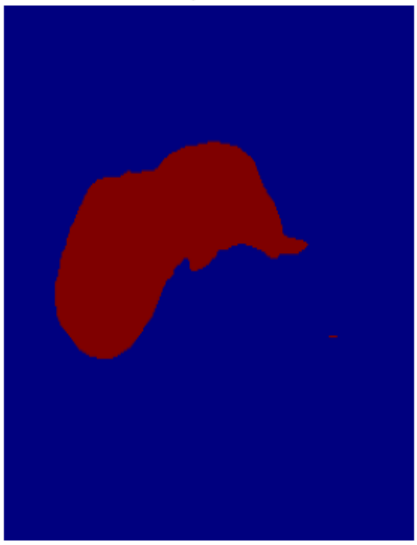
Patient: Jean Dupont
Date: February 19, 2026

SEGMENTATION VIEW

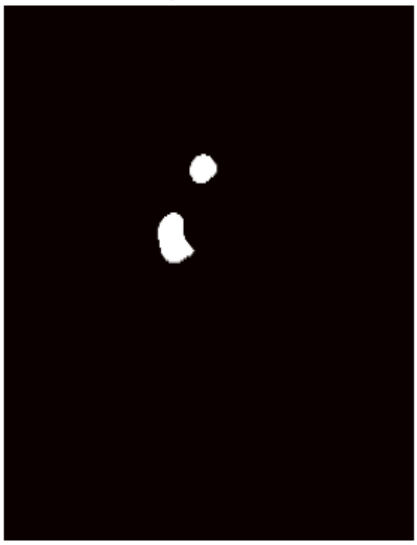
Image CT



Masque Foie



Masque Tumeur



Clinical Assessment & Findings:

The volumetric reconstruction provides a detailed view of the hepatic segments. The lesion is clearly demarcated within the right lobe, showing no signs of infiltration into the portal vein.

Conclusion:

The segmented tumor volume is measured at 52.4 cm³. The margins are stable. A multi-disciplinary team review is scheduled for further surgical planning.
